

J-POWER Group Annual Report 2016

J-POWER (Electric Power Development Co., Ltd.) is a power generator with operations throughout Japan and overseas. Since its establishment by the government in 1952 to overcome the power shortages in postwar Japan, J-POWER has developed its business in the wholesale supply of hydroelectric and thermal power, conducted a power transmission business through its trunk transmission lines that connect each domestic region, and contributed to the stable supply of electric power in Japan.

Listed on the Tokyo Stock Exchange's First Section and thus becoming fully privatized in 2004, J-POWER has been developing new businesses, including electric power generation businesses in foreign countries where growth is expected, and renewable energy, such as wind and geothermal power.

By making the most of its expertise regarding leading-edge technologies developed throughout the world and its proven record of trustworthy performance, J-POWER is making steady and farsighted progress on the basis of its "coexistence of energy and the environment" concept.

Forward-Looking Statements Statements in this annual report, other than those of historical fact, are forward-looking statements about the future performance of J-POWER that are based on management's assumptions and beliefs in light of information currently available, and involve both known and unknown risks and other uncertainties. Actual events and results may differ materially from those anticipated in these statements.

Presentation of Monetary Amounts and Other Figures

For monetary amounts and electric power sales, figures less than the indicated unit are rounded down. For other fiaures amounts, figures less than the indicated unit are rounded to the nearest unit unless otherwise mentioned.

Consolidated Power Generation Capacity in Operation (Owned Capacity Basis)

(As of August 31, 2016)

Domestic 74% 17,836 MW

Thermal	8,849 MW*	37%
Hydroelectric	8,571 MW	35%
Wind Power	415 MW	2%

* Includes geothermal power generation

Overseas 26% 6,308 MW

Thailand	3,300 MW
United States	1,442 MW
China	910 MW
Other areas	656 MW

J-POWER Group's Electric Power Business—Supporting the Stable Supply of Electric Power in Japan

Domestic

J-POWER's core business is its electric power generation business comprising power plants it owns and operates throughout Japan that supply electricity to electric power retailers. We also employ our transmission and transforming facilities to provide transmission services.

Isogo Thermal Power Plant (Kanagawa Prefecture)

Global Business Development

Overseas

J-POWER is leveraging its almost 50 years of overseas achievements and know-how as it engages in its overseas power generation business and overseas consulting business. J-POWER is contributing to the stable supply of electric power and sustainable development throughout the world.

U-Thai IPP (Thailand)

Electric Power Business

Thermal Power

Highly Economical Base Energy Source

J-POWER owns thermal power generation facilities with a total capacity of 8,849 MW, including the top share of coal-fired thermal power generation capacity in Japan (an owned capacity of 8,527 MW). The special feature of coal-fired thermal power generation is the lower cost per calorie compared with power generation by crude oil, LNG, and other fossil fuels. Reflecting

the use of coal-fired facilities to meet base demand, they have high capacity load factors and can be said to be outstanding sources of power in terms of economy.

Hydroelectric Power

Purely Domestic, CO₂-Free Energy

J-POWER owns 60 hydroelectric power plants with a total capacity of 8,571 MW, making it Japan's second-ranked company in terms of hydropower generation capacity. Hydroelectric power represents a valuable purely domestic energy resource and, as a CO₂-free power source, plays a central role in renewable energy. Moreover, because hydroelectric power plants are able to

rapidly respond to changes in electricity demand, they are used mainly in the daytime, when demand reaches its peak levels.

Wind Power

Power Generation Business for a Low-Carbon Society

J-POWER owns 21 wind power facilities with a total capacity of 429 MW (also 415 MW on an owned capacity basis; as of August 31, 2016), making it Japan's second-ranked company in terms of wind power generation capacity. Because wind power is a clean, CO2-free power source and a form of

Share of Wind Power Generation Capacity in Japan (As of March 31, 2016)

> J-POWER 13%

renewable energy, J-POWER will continue promoting new wind power development going forward.

Transmission/Transformation

Core Infrastructure Supporting Japan's Electric Power Network J-POWER has major transmission lines with a total length of approximately 2,400 km, including trunk lines that connect Honshu with Hokkaido, Shikoku, and Kyushu. We also own a frequency converter station that links the different frequencies of eastern and western Japan. These facilities are key infrastructure elements that play extremely important roles in the comprehensive management of Japan's nationwide power grid.

Overseas Power Generation Business

From the late 1990s, J-POWER has been working on its overseas power generation business, which invests the Company's funds and technology and participates in electric power generation projects. As of August 31, 2016, the J-POWER Group owns power generation facilities that are in operation in six countries and regions, including Thailand, the United States, and China. These facilities have a total capacity of 6,308 MW (owned capacity basis). Furthermore, in Indonesia, the Company is advancing a highefficiency, coal-fired thermal power plant project (total output of 2,000 MW), aiming for completion in 2020.

Overseas Consulting Business

J-POWER has conducted its overseas consulting business, which involves technical cooperation related to electric power development and environmental preservation, since the 1960s. As of March 2016, the Company has executed a cumulative total of 355 projects in 64 countries and regions.

Power Generating Capacity of J-POWER (Wholesale Electric Power Business) and 10 Electric Power Companies (EPCOs) (As of March 31, 2016)

Source: Reports issued by the Agency for Natural Resources and Energy

Power Generation by Power Source in Japan

While hydroelectric power previously accounted for the bulk of electric power generating capacity in Japan, there was later a shift to the use of thermal power fueled by abundant and inexpensive oil. Since the oil shocks, the development of coal-fired and natural gas-fired thermal power generation as well as nuclear power has advanced, and efforts have been made to diversify power generation methods. The operation of nuclear power plants in Japan has been suspended since the accident at the Fukushima Daiichi Nuclear Power Plant in 2011, making coal and gas-fired thermal power the main pillar of electricity supply in Japan.

substances (including power received). Figures for total power generation volume are for the 10 EPCOs (including power received). Source: Agency for Natural Resources and Energy

Electricity System Reform

Until now, the electric power supply system has comprised the traditional, vertically integrated electric power companies (EPCOs); wholesale power companies, including J-POWER, and wholesale suppliers (IPPs) that supply electricity to EPCOs; and power producers and suppliers (PPSs). Amid a trend toward enhanced electric power industry liberalization, the revision of the Electricity Business Act created systems that enabled the creation of IPPs and PPSs and allowed companies other than electric power companies to engage in the wholesale supply of power to electric power companies as well as the retail distribution of power from 1995 onward. Since 2005, electric power transactions have been carried out at the Japan Electric Power Exchange (JEPX).

Due in part to the Great East Japan Earthquake and the accident at TEPCO's Fukushima Daiichi Nuclear Power Plant, electricity generation costs have been rising, and the balance of electric power supply and demand in Japan is tightening. In response, the government is advancing electricity system reform as part of efforts to rebuild its energy policy.

The three goals of the reform are securing the stable supply of electricity, suppressing electricity rates to the maximum extent possible, and providing consumers with choices as well as business operators with opportunities to expand their businesses. To achieve these goals, electricity system reform will be implemented in three stages, namely expanding the operations of wide-area electricity grids, fully liberalizing the retail market and power generation, and further securing the neutrality of the power transmission/distribution sector through legal unbundling.

So far, based on the Policy on Electricity System Reform approved by the Cabinet in April 2013, the Electricity Business Act was amended in November 2013, and the Organization for Cross-regional Coordination of Transmission Operators (OCCTO) was established in April 2015. In line with the Electricity Business Act amendment of June 2014, entry into the retail market was fully liberalized and electricity wholesale regulations^{*1} abolished in April 2016. Furthermore, in June 2015, the Electricity Business Act was amended to include provisions for the legal unbundling of the transmission/distribution sector and revisions to electricity retail rate regulations (scheduled for 2020).^{*2}

- *1 Rates for the supply of electricity to EPCOs in excess of set amounts or time frames were calculated on a cost basis and submitted to the Minister of Economy, Trade and Industry.
- *2 The full liberalization of retail rates for electricity will be implemented after the government has verified how much market competition has progressed.

Steadily Advancing the Medium-Term Management Plan to Secure Further Growth

I was honored to assume the position of president of J-POWER in June 2016. In this role, I will do my utmost to help meet the expectations of our stakeholders.

Looking at Japan's electric power industry, in July 2015, the Japanese government published its Long-Term Energy Supply and Demand Outlook. The outlook sets energy mix targets for renewable energy, nuclear power, coal-fired thermal power, and other power sources, in addition to establishing new, internationally oriented CO₂ reduction targets. At the same time, the business environment is undergoing major changes, including the full-scale liberalization of retail business and the abolishment of wholesale regulations in April 2016 as well as the unbundling of power generation and transmission scheduled for 2020.

Responding to the changing landscape, in July 2015, the J-POWER Group established a Medium-Term Management Plan to address the challenge of achieving further growth over the next decade. The basic direction of our efforts under the plan comprise three initiatives: (1) creating a platform for further growth in the domestic market as it undergoes liberalization and in order to survive competition in power generation by being cost-competitive; (2) growing our overseas power generation business to contribute to sustainable development based on the energy circumstances in each region worldwide; and (3) conducting business in Japan and abroad as a leading company in coal-fired thermal power generation by accelerating the development of technology aimed at reducing the carbon emissions of coal-fired thermal power to adapt to measures addressing climate change.

At the moment, we are advancing preparations to begin trials in March 2017 at the Osaki CoolGen Project's demonstration plant. This plant will utilize oxygen-blown integrated coal gasification combined cycle (IGCC) technology to reduce carbon emissions from coal-fired thermal power, a key pillar of our growth strategies. Furthermore, in Japan, replacement construction at the Takehara Thermal Power Plant is progressing smoothly. Overseas, all our power generation projects in Thailand were online as of 2015, and we will soon begin in earnest the construction of a high-efficiency coal-fired thermal power plant in Indonesia. Through such efforts, the J-POWER Group is steadily advancing, step by step, toward the achievement of the goals of the Medium-Term Management Plan.

Meanwhile, there remain a number projects that have yet to get fully under way as we strive toward the goals of the plan; indeed, we have really only just begun to implement the plan. As president, I will continue striving to launch and bring these projects to fruition and thereby secure the continued growth of the J-POWER Group.

We will continue to do our utmost under our Corporate Philosophy: "We will meet people's needs for energy without fail, and play our part for the sustainable development of Japan and the rest of the world."

We are grateful as always for your continued support and patronage.

Toshifumi Watanabe President September 2016

Responding to Electricity System Reform

Question

The full-scale liberalization of the retail business and abolishment of wholesale regulations in Japan came into effect in April 2016. How will the J-POWER Group grow domestically?

Answer

Until now, J-POWER has supplied electricity to Japan's electric power companies (EPCOs) as a wholesale power company. From April 2016, however, we must compete for survival as one power generator among many.

The key to surviving amid such competition is cost-competitiveness.

The majority of the J-POWER Group's power generation facilities use large-scale hydroelectric power generation, an entirely domestic source of CO₂-free energy, or coal-fired thermal power, the fuel for which can be procured more cheaply and stably than oil or liquid natural gas (LNG). As such, in terms of cost, we are amply competitive.

The graph at right shows the price per unit of thermal energy of oil, LNG, and coal imported to Japan over time. As the graph illustrates, even after the recent sharp drop in oil and (Yen/Mbtu) 2,500 1,500 1,500 1,000 500 0 103 '04 '05 '06 '07 '08 '09 '10 '11 '12 '13 '14 '15 '16 011 LNG Coal

Source: CIF price shown in Trade Statistics of Japan is converted at a rate of 252 Cal/Btu

LNG import prices due to lower resource prices worldwide, the price of coal is still lower. Furthermore, over the long term, oil and LNG prices fluctuate enormously, but coal prices remain stable and low. Based on these factors, we believe the costcompetitiveness of coal-fired thermal power is secure.

J-POWER is currently advancing the development of new coal-fired thermal power plants in Japan. These plants will begin to come online in 2020, further expanding our generation capacity.

Import Price of Fossil Fuel in Japan

The J-POWER Group will aim for further growth by leveraging the excellent cost-competitiveness of its coal-fired thermal power and other generation facilities.

Until now, we have operated the domestic electric power business basically on a cost basis, selling power at a price calculated to provide cost recovery plus a fair return. In a liberalized market, there is no guarantee that we will be able to obtain such compensation. As such, the range of variation in profitability due to such factors as the electricity market environment and the operational status of generation facilities will be wider than before.

In this sense, the best risk management we can implement as a power generator is to maintain the stable operation of our profitable power generation facilities. We will continue to pursue the ongoing optimization of maintenance and operations, working to increase productivity and thus the value of our facilities.

Furthermore, the J-POWER Group includes electric power generation businesses in the United States and other countries outside Japan. Using our experience in electric power businesses in such liberalized markets, we will work to implement appropriate risk management in the domestic market as it liberalizes.

The purpose of electricity system reform in Japan is to establish a healthy, competitive market. To realize this aim, cross-regional power grids, including transmission lines and substations, must function soundly. The J-POWER Group owns cross-regional connecting lines, a frequency converter station, and other such power grid facilities. To ensure a stable supply of electricity and support a healthy, competitive market, we are ramping up cross-regional efforts to upgrade and maintain the sound functioning of these facilities.

Business Based on Japan's Energy Mix

Question

At COP21, Japan committed to reducing its greenhouse gas emissions 26% by fiscal 2030. Coal-fired thermal power generation emits more CO₂ than other methods. Does the J-POWER Group expect growth centered on coal-fired thermal power generation going forward?

Answer

Japan depends on imports for virtually all of its fossil fuels, and the country has gone through two oil shocks in the past. Utilizing a good balance of diverse energy sources is therefore essential. Because coal can be procured at prices that are both low and stable, as I mentioned before, coal-fired thermal power is positioned as an important baseload power source that accounts for 26% of the energy mix Japan is targeting for 2030. It is true, however, that coal produces a greater volume of CO₂, a greenhouse gas, than other fossil fuels. The government's Long-Term Energy Supply and Demand Outlook says about fossil fuels that it will "Realize higher efficiency of coal-fired and LNG-fired thermal power generation, and promote their effective utilization, while ensuring compatibility with reduction of environmental load."

The electricity industry is building a voluntary framework so that the industry as a whole will be able to reach the CO₂ reduction target. To support these efforts, the government is creating and adjusting legal rules for power generators and retailers with the aim of securing effectiveness and transparency. As part of the electricity industry, the J-POWER Group is working to fulfill its responsibilities under this framework. Currently, to reduce CO₂ emissions from its coal-fired thermal

Average Gross Thermal Efficiency (LHV) of Coal-Fired Thermal Power Plants by Country

■ Isogo Unit New No. 1 ■ J-POWER ■ Japan ■ Germany ■ U.K. & Ireland ■ U.S.A. ■ China ■ Australia ■ India

Source: Ecofys International Comparison of Fossil Power Efficiency and CO₂ Intensity 2015, results for J-POWER and Isogo Unit New No. 1

power generation operations, the J-POWER Group is advancing the replacement of aging power generation facilities, such as those at the Takehara and Takasago plants, and developing new, high-efficiency coal-fired thermal power generation facilities using world-leading technology, such as the Kashima Power and Yamaguchi Ube Power projects.

Furthermore, we are developing IGCC, CSS, and other nextgeneration coal-fired thermal power generation technologies aimed at reducing CO₂ emissions. For example, we are actively advancing the Osaki CoolGen Project. As a leader in coal-fired thermal power generation, we will do our part to make coalfired thermal power generation more efficient, with fewer carbon emissions.

The J-POWER Group has constantly been at the forefront in adopting cutting-edge coal-fired thermal power generation technologies over the decades. As a result, we possess not only high-efficiency power generation technologies that emit less CO₂, but also environmental technologies that reduce emissions of such atmospheric pollutants as sulfur oxides (SOx) and nitrogen oxides (NOx) to levels on par with gas-fired thermal power generation.

In addition, CO₂-free renewable energy sources account for about half of the J-POWER Group's generation capacity. We will continue working to actively expand our use of renewables.

Question

You said that you aim to expand the development of renewable energy. What initiatives are you implementing in this area?

Answer

Japan is targeting an energy mix in 2030 that includes 22% to 24% renewables, a major increase from the current level of about 10%. Constituting power sources that emit no greenhouse gases (i.e., CO₂), are fully domestically produced, and not dependant on imported fuel, renewable energy will only grow in importance.

Since its founding, the J-POWER Group has generated a great deal of electricity using hydroelectric power, which is fully

domestically produced and CO₂-free. We boast the secondhighest hydroelectric power generation capacity in Japan. We are also number two in wind power generation capacity. Wind power is expected to see accelerating growth going forward, and we will continue to actively advance new development in this area. Furthermore, the J-POWER Group will utilize its technological prowess in the field of renewable energy, developing new facilities for geothermal power generation—which, unlike many other CO₂-free power sources, is not influenced by weather, enabling a steady power supply year-round—as well as the combined combustion of biomass in coal-fired thermal power generation, thus remaining a top runner in this area.

Overseas Business Development

Question

Please tell us about the Group's power generation business in Thailand and the progress of power generation business development in Indonesia.

Answer

In Thailand, Unit No. 2 of the U-Thai gas-fired thermal power plant came online in December 2015, marking the completion of the power generation projects we had been advancing through our consolidated subsidiaries in the country. With these new projects in Thailand in operation, the J-POWER Group now has a total owned capacity of 6,308 MW at its overseas power generation facilities. The ongoing steady operation of these facilities is expected to not only contribute to the J-POWER Group's profit, but also to Thailand's economic growth.

In Central Java, Indonesia, we are developing a coal-fired thermal power generation project. Indonesia's electricity demand is expected to rise sharply going forward. This project will help meet that demand with the construction of a 2,000 MW high-efficiency, coal-fired thermal power plant that will be fueled by Indonesia's abundant coal reserves. The plant is

slated for completion in 2020. We expect the use of the J-POWER Group's coal-fired thermal power generation technologies, which boast thermal efficiency that is among the highest in the world and cleanness on par with gas-fired generation, to help solve Indonesia's energy problems in a way that suits the country's circumstances.

Question

Will the overseas power generation business continue to expand going forward?

Answer

We foresee highly robust electricity demand in emerging countries, especially in Asia. As I said, the price of coal is low and stable, and as such there is strong demand for coal-fired thermal power in emerging countries. However, countermeasures to protect the environment from SOx, NOx, soot and other such pollutants and to reduce emissions of such greenhouse

Central Java Coal-Fired IPP Project

Power generation method:	Coal-fired ultra supercritical pres- sure power generation
Generation capacity:	2,000 MW
J-POWER's ownership:	34%
Scheduled start of operations:	2020

gases as CO₂ are also necessary. We aim to expand opportunities for the J-POWER Group to utilize its accumulated technological capabilities related to coal-fired thermal power generation as well as its abundant overseas business experience. Furthermore, we expect abundant business opportunities in the United States, where we have an established business platform and market liberalization is already advanced. By taking advantage of such wide-ranging overseas business opportunities, we aim to achieve the goal set forth in our Medium-Term Management Plan of expanding our overseas generation capacity to 10,000 MW by fiscal 2025.

The Ohma Nuclear Power Plant Project

Question

Is the Ohma Nuclear Power Plant Project important for Japan?

Answer

Yes, I believe it is. Japan is a resource-poor island nation. From the perspective of ensuring a stable energy supply, nuclear power generation is therefore an indispensible baseload power source. At the same time, nuclear power plants are an important part of countermeasures to global warming, as their operation emits no CO₂.

Some plutonium remains in the spent fuel from nuclear power plant operations. In principle, to guard against nuclear non-proliferation, Japan does not hold surplus plutonium. For this reason and to use resources effectively, Japan promotes a nuclear fuel cycle in which spent fuel is reprocessed so that the plutonium and other useful materials are recovered and utilized.

Given this cycle, an important point about the Ohma Nuclear Power Plant is that it will be able to operate using only uranium-plutonium mixed oxide (MOX) fuel. Japan's existing nuclear power plants can use up to about one third MOX fuel. As we are aiming to use only MOX fuel at the Ohma Nuclear Power Plant, it will play an important role in the nuclear fuel cycle.

The Ohma Nuclear Power Plant is currently still under construction. We applied to the Nuclear Regulation Authority for reviews of compliance with the New Safety Standards in December 2014. In addition to appropriately responding to the results of reviews, we are advancing independent efforts and steadily implementing extensive safety measures, which are a necessary condition for commencing operations.

Overview of Ohma Nuclear Power Project							
Location	Ohma-machi, Shimokita-gun, Aomori Prefecture						
Capacity	1,383 MW						
Type of nuclear reactor	Advanced Boiling Water Reactor (ABWR)						
Fuel	Enriched uranium and uranium- plutonium mixed oxide (MOX) fuel						
Start of construction	May 2008						
Start of operation	To be determined						

Corporate Governance

Question

What kind of corporate governance initiatives are you implementing?

Answer

In October 2015, we established a Basic Policy on Corporate Governance that concretely lays out our initiatives in response to the new Corporate Governance Code. This basic policy clarifies how we plan to realize the Group's corporate philosophy by enhancing corporate value over the long term and earning stakeholder trust. Under the basic policy, we will continue working to enhance corporate governance. For details on the basic policy and corporate governance, please refer to Corporate Governance under the Management System section (page 36).

Question ------

The number of outside directors at J-POWER has increased. What effect do you expect this to have?

Answer

We now have three outside directors, two of whom are Japanese and one of whom is British. In line with the Basic Policy on Corporate Governance, we select as outside

directors individuals who will be able to make constructive contributions to Board of Directors' discussions from the perspective of promoting sustainable growth and increasing corporate value over the medium-to-long term. Our current three outside directors not only have a good understanding of the J-POWER Group's businesses, they have expert knowledge in such areas as electricity and public utility businesses, law, finance, overseas business and corporate governance. We are involving the three outside directors in management and utilizing their respective expertise and wide-ranging insight to enhance the Board of Directors' lively, constructive discussions of all kinds of topics. I expect this to contribute to the realization of the J-POWER Group's sustainable growth and the enhancement of its corporate value over the medium-to-long term. The Basic Policy on Corporate Governance states that the Board of Directors should be composed of directors that have a wealth of experience and insight as well as a high level of expertise, while the board as a whole should maintain balance and diversity in terms of insight, experience, and abilities. In keeping with this policy, the addition of our current three outside directors enhances the makeup of our Board of Directors.

For more information about the directors, Audit & Supervisory Board Members, and executive officers approved at the June 22, 2016 Shareholders' Meeting, please refer to Directors, Audit & Supervisory Board Members, and Executive Officers on page 40.

The J-POWER Group Medium-Term Management Plan

The J-POWER Group established a Medium-Term Management Plan in July 2015 to address the challenge of achieving further growth over the next decade by leveraging the increase in capital carried out in March 2015.

The basic direction of our efforts involves I. creating a platform for further growth in the domestic market as it undergoes liberalization and in order to survive competition in power generation by being cost-competitive; II. growing our overseas power generation business to contribute to sustainable development based on the energy circumstances in each region worldwide; and III. conducting business in Japan and abroad as a leading company in coal-fired thermal power generation by accelerating the development of technology aimed at reducing the carbon emissions of coal-fired thermal power to adapt to measures addressing climate change.

Efforts aimed at further growth by building up the power generation business will require a growth cycle of at least 10 years considering the period required for investment in construction after planning and environmental assessment. That is why we made efforts aimed at 2025 into the J-POWER Group's "Medium-Term Management Plan."

Business Environment, Key Concepts of the Medium-Term Management Plan, and Six Key Initiatives

The business environment surrounding J-POWER Group

- Intensifying market competition due to the electricity system reform
- Uncertainty surrounding nuclear power policy
- Climate change
- Robust growth in electric power demand centered upon developing countries

J-POWER Group's strengths in finding opportunities in environmental changes

- Competitive power plants producing large volumes of electric power
- Abundant development pipeline
- Excellent environmental technology enabling future business development
- Track record in overseas business development

Responses to risks to overcome

Initiatives to further reduce carbon emissions

Key concepts of the Medium-Term Management Plan based on the above understanding of business environment and J-POWER Group's strengths

- Realize growth in Japan by "Surviving the Competition in a Liberalized Market"
- Enhancing "Overseas Business Expansion"
- Further "Low-carbon Technologies" enabling greater business growth globally

6 Key Initiatives

- (1) Promotion of **development of high-efficiency coal-fired thermal power plants** and **technology** aimed at the next generation
- (2) Being competitive in the market created by liberalization and improvement of reliability of facilities
- (3) Expansion of renewable energy
- (4) Promotion of the Ohma Nuclear Power Project based on the premise of safety
- (5) Promotion of overseas power generation business
- (6) Improvement of efficiency of assets by screening businesses

Growth and Soundness Indicators: Specific Targets

- Growth indicator: J-POWER EBITDA*
- ⇒ Increase to around 1.5 times the level of FY2014 in FY2025 (FY2014 result: ¥181.8 billion)
- Soundness indicator: Interest-bearing debt / J-POWER EBITDA
- ⇒ Improve from the level at the end of FY2014 by the end of FY2025

(FY2014 year-end result: 9.5 times)

* J-POWER EBITDA = Operating income + Depreciation and amortization + Equity in earnings of affiliates

Returns to Shareholders

- Although our overseas business has reached a stage in which we expect profit to grow, we remain in a period of asset formation aimed at further growth
- At the same time, J-POWER Group is in a transitional period in which its business environment undergoes significant change moving forward to FY2020 caused by factors such as progress of liberalization
- Therefore, during this period, we will continue to provide stable dividends as in the past, while also working to form competitive business assets and also maintain and improve our financial soundness
- After FY2020, we will strive to enhance the returns to shareholders as a result of our growth, and also flexibly consider how returns to shareholders should be decided, based on factors such as changes in our earnings structure

The J-POWER Group's corporate philosophy is "We will meet people's needs for energy without fail, and play our part for the sustainable development of Japan and the rest of the world." In line with this philosophy, we are working to both ensure the stable supply of electric power and promote environmental preservation. Around the world, the Group owns facilities that use a variety of power sources, including coal-fired thermal, gas-fired thermal, hydroelectric, and other renewable energy

Hydro

9.1 GW

sources, maintaining a balanced portfolio of facilities.

Going forward, the J-POWER Group will continue to advance the development of such CO_2 -free energy sources as hydroelectric, wind, and geothermal power while also reducing carbon emissions from coal-fired thermal power generation. By doing so, we will strive to both ensure a stable supply of electric power and reduce CO_2 emissions.

Developing Large-Scale Hydroelectric Power Plants

To alleviate Japan's nationwide postwar power shortages, in the 1950s J-POWER began building large-scale dams and hydroelectric power plants, such as the Sakuma, Tagokura, Okutadami, and Miboro power plants. These facilities have not only contributed to the effective use of water resources and stable supply of electric power, but as a CO₂-free power source, they have helped to address the issue of global warming.

The J-POWER Group currently has 60 hydroelectric power production facilities in Japan, making it Japan's second-ranked company in terms of hydropower generation capacity.

Initiatives in Imported Coal-Fired Power

After the two oil shocks of the 1970s, J-POWER advanced construction of largescale coal-fired thermal power plants fueled by imported coal, of which large reserves were available. Japan's first such plant was the Matsushima Thermal Power Plant. This was followed by the completion of six more thermal power plants fueled by imported coal across the country. For a half century, the J-POWER Group has striven to improve the efficiency of these plants and reduce their environmental burden, and they have contributed to the stable supply of electric power in Japan.

Gas-Fired Power Generation in Thailand

Overseas, the J-POWER Group is developing various power sources in line with the particular needs of each country and region. For example, in Thailand, we have been developing large-scale gas-fired thermal power generation facilities that use the natural gas produced in abundance within the country and surrounding region. We are also developing biomass projects, contributing to economic development and the stable supply of electric power in Thailand.

Reducing Carbon Emissions from Coal-Fired Thermal Power

The Position of Coal-Fired Thermal Power in Japan's Energy Policy

While coal-fired thermal power emits a large volume of CO₂, among fossil fuels it is subject to the least geopolitical risk and has the lowest import cost per unit of thermal energy. As such, it is an important baseload power source that has a stable fuel supply and is economical. It is thus in Japan's interest to use this power source while working to reduce its environmental burden through such means as effectively employing high-efficiency coal-fired thermal power generation technologies. Coalfired thermal power accounts for about 26% of Japan's target energy mix for fiscal 2030.

The J-POWER Group is working to reduce carbon emissions by replacing aging coal-fired thermal power facilities with new high-efficiency facilities that employ world-class technologies and by developing new facilities that are also highly efficient. Furthermore, by promoting mixed combustion

Growing Electric Power Demand in Asia

Demand for electric power is growing in Asia. Coal-fired thermal power, which offers the merits of a stable fuel supply and being highly economical, will be an important driver of economic development.

In Central Java, Indonesia, we are developing a coal-fired thermal power generation project. Indonesia's electricity demand is expected to rise sharply going forward. This project will help meet that demand with the construction of a high-efficiency thermal power plant fueled by Indonesia's abundant coal reserves. By leveraging its world-class, high-efficiency coal-fired thermal power technologies, the J-POWER Group will be able to both contribute to Indonesia's economic development and reduce carbon emissions. employing biomass fuels, we are advancing the further reduction of carbon emissions from coal-fired thermal power plants.

Developing Next-Generation, Coal-Fired Thermal Power Technology and Low-Carbon Technology

J-POWER is working to establish next-generation, coal-fired thermal power technology by developing integrated coal gasification combined cycle (IGCC*1) technologies and integrated coal gasification fuel cell combined cycle (IGFC*2) as well as CO2 capture and storage (CCS) technologies. Since fiscal 2002, J-POWER had been engaged in the EAGLE*3 project in collaboration with the New Energy and Industrial Technology Development Organization (NEDO), aimed at establishing technology to realize oxygen- blown IGCC. Employing insights and results gleaned from the EAGLE project, the Company has since been engaged in the Osaki CoolGen Project in collaboration with The Chugoku Electric Power Co., Inc. Under this project, the construction of a 166 MW oxygen-blown IGCC demonstration plant (with a coal processing capacity of 1,180 tons per day) commenced in March 2013, and trials are slated to begin in fiscal 2016. Thereafter, besides conducting further testing of CO₂ separation and capture technology, J-POWER is aiming to develop oxygen-blown IGFC technology that combines fuel cells with oxygen-blown IGCC. J-POWER's other initiatives to reduce carbon emissions include collaboration with Mitsubishi Heavy Industries, Ltd. in conducting pilot trials related to the development of CO₂ separation and capture technology from fiscal 2007 to 2008 at the Matsushima Thermal Power Plant in Saikai City, Nagasaki Prefecture. Additionally, at the Callide A Power Plant in Queensland, Australia, J-POWER took part in the world's first trials of an integrated process of oxy-fuel and CCS at a real power plant as part of a publicprivate, Japanese-Australian joint project.

^{*1} Integrated Coal Gasification Combined Cycle (IGCC): A combined cycle power generation system with a twin-turbine configuration; a gas turbine driven by the gas produced by gasifving coal and a steam turbine driven by the exhaust gases from the gas turbine

^{*2} Integrated Coal Gasification Fuel Cell Combined Cycle (IGFC): An integrated power generation system that combines fuel cells with IGCC which achieves the highest level of thermal efficiency as coal-fired thermal power

^{*3} EAGLE: An oxygen-blown coal gasification project which was conducted at the Wakamatsu Research Institute. The acronym is taken from Coal Energy Application for Gas, Liquid & Electricity.

Coal-Fired Thermal Power Technology for the Next Generation

*4 Ultra-Supercritical (USC): Current cutting-edge technology for pulverized coal-fired thermal power. Utilizes steam with pressure of 22.1 MPa or greater and temperature of over 566°C *5 Advanced Ultra-Supercritical (A-USC)

By the adoption of steam condition at more than 700°C, increased the thermal efficiency of USC

Reference: Initiatives to Reduce CO2 in Japan

As an operator in Japan's electricity business, J-POWER is helping to achieve the targets of the electricity business's Action Plan for Achieving a Low-Carbon Society.

To confirm compliance with the new safety standards, in December 2014 J-POWER submitted an application for permission for alteration of the reactor installment license and an application for construction plan approval to the Nuclear Regulation Authority summarizing the details of measures to reinforce the safety of the Ohma Nuclear Power Plant. We will implement all measures during construction to ensure that we build a safe power plant.

Measures to Reinforce Safety

1. Measures to Design Basis Accidents

Earthquake Proofing

We adopted a new standard seismic motion based on the latest findings and other factors. The adopted standard seismic motion is a maximum acceleration of 650 cm/s² (previously 450 cm/s²). Earthquake-proof designs for buildings and other structures were adopted based on this standard seismic motion.

Tsunami Countermeasures

We also adopted the following design basis tsunami based on the latest findings. We estimated that the maximum height of a tsunami at the site based on the following design basis tsunami is T.P. +6.3 m (previously +4.4 m), but the elevation of the power station site is T.P. +12 m, and consequently, there is no likelihood of a tsunami reaching and following into the site.

From the perspective of enhancing confidence even further, we will implement independent measures including construction of seawalls and installation of waterproof exterior doors and so on.

Measures to Prevent Damage from External Impact

(1) We assessed the impact of natural phenomena (volcanic eruptions, tornados, external fires, etc.) on the nuclear power station.

Fire Protection

(2) We will enhance fire protection measures including use of fire resistant cables and construction of firewalls.

Internal Flooding Resistance Measures

(3) We will reinforce resistance measures against leaks to protect facility functions in anticipation of damage to pipes within the facility.

2. Against Severe Accidents and Terrorism

To prevent damage to the nuclear reactor and containment vessel, we will implement the following measures.

Measures to Prevent Core Damage and Containment Vessel Failure

(4) Even in the case where nuclear reactor emergency shutdown equipment does not operate, an alternative control

Image of Measures to Reinforce Safety at Ohma Nuclear Power Plant

rod insertion mechanism that can be operated by separate circuits or manually will be installed to enable shutdown of the nuclear reactor.

- (5) Permanent alternative water injection facilities will be installed to cool the nuclear reactor, containment vessel, and spent fuel storage pool.
- (6) Mobile alternative water injection pumps will be available to cool the nuclear reactor, containment vessel, and spent fuel storage pool.
- (7) An alternative automatic depressurization system will be installed to reduce pressure in the nuclear reactor.
- (8) Heat exchanger units will be installed to release generated heat.
- (9) A filtered containment venting system^{*1} will be installed to prevent damage from excess pressure in the containment vessel.
- (10) Static catalytic hydrogen re-coupling devices^{*2} will be installed to prevent damage from hydrogen explosions in the reactor building.
- (11) Water spraying facilities will be installed to control the dispersion of radioactive material outside the power station.

Reinforcement of Power and Water Supplies

(12) To ensure power supplies, air-cooled emergency generators and gas turbine generators will be installed, the capacity of existing storage batteries will be increased, additional batteries will be installed, and a power supply vehicle will be made available. (13) Water storage tanks will be installed to secure a water source necessary for resolution of severe accidents.

Ensuring Support Functions of the Control Room

- (14) An emergency response office will be created to respond to severe accidents.
- (15) Communications facilities will be reinforced to ensure communications with necessary locations inside and outside the power station.
- (16) Mobile monitoring posts will be established to monitor, measure and record the concentration and radio-activity of radioactive material in the vicinity of the power station.

Countermeasures against Intentional Aircraft Crashes

(17) Specified severe accident response facilities will be established to control the abnormal external release of radioactive material in the event of the intentional crash of a large aircraft into the reactor buildings or other terrorist attacks.

*1. Filtered containment venting system:

A system that controls the release of radioactive material and releases steam from the containment vessel into the atmosphere in order to prevent damage to the containment vessel in the event of an excessive increase in pressure inside the nuclear reactor containment vessel.

*2. Static catalytic hydrogen re-coupling devices:

A system that uses a catalyst to cause a chemical reaction between hydrogen molecules and oxygen molecules to generate water vapor in order to prevent an increase in hydrogen concentration that could result in a hydrogen explosion in the event that damage to the reactor core occurs, causing hydrogen to leak inside the reactor building and the concentration of hydrogen to increase.

Electric Power Business

Domestic Electric Power Business (Thermal Power)

Overview of Operations and Salient Features

J-POWER's thermal power operations center on coal-fired thermal power generation. J-POWER's first coal-fired thermal power plant commenced operations in 1963, in line with Japan's policy at the time of using domestically produced coal. Following the oil shocks of the 1970s, the Company responded to government plans to diversify the mix of power sources, which had been centered on oil-fired thermal power generation. In 1981, J-POWER began operations at the Matsushima Thermal Power Plant, the first in Japan fueled with imported coal. J-POWER went on to develop a series of large-scale coal-fired thermal power plants-such as those at Matsuura and Tachibanawanthat run on imported coal, increasing the scale of its business. The Company has continued to work to improve power generation efficiency by enhancing steam conditions and scaling up plants in its efforts to improve competitiveness and decrease environmental impact. Providing an economical and stable baseload source of electricity, J-POWER's coal-fired thermal power plants maintain high load factors.

J-POWER is also involved in geothermal power, and has been operating the Onikobe Geothermal Power Plant in Osaki City, Miyagi Prefecture, since 1975.

Tachibanawan Thermal Power Plant

History of J-POWER's Thermal Efficiency Improvements

We achieved the world's highest level of thermal efficiency at Isogo thermal power plant New No. 2 unit.

* Isogo No. 1 (started operation in 1967) and No. 2 (1969) have been replaced with cutting-edge units.

Replacement and New Capacity Projects

J-POWER is promoting new coal-fired thermal power projects to replace aging thermal power plants and develop new power plants to contribute to the stable supply of electricity in Japan over the medium-to-long term. Because these projects will commence operations after the abolition of wholesale regulations that has been implemented as part of Japan's electricity system reform, unlike the coal-fired thermal power plants J-POWER has developed in the past, the terms of their business contracts, such as who they sell to and at what rate, will not be restricted by said regulations.

In addition to taking these coal-fired thermal power initiatives, J-POWER is promoting the construction of its second geothermal power plant, in the city of Yuzawa, Akita Prefecture. Construction of the Wasabizawa Geothermal Power Plant (capacity 42 MW) by a joint venture with Mitsubishi Materials Corporation and Mitsubishi Gas Chemical Company, Inc., is under way, and the start of operations is planned for May 2019. Furthermore, the Onikobe Geothermal Power Station will be shut down in fiscal 2016 for replacement going forward.

Domestic Electric Power Business (Hydroelectric Power)

Overview of Operations and Salient Features

J-POWER boasts a track record in the building and operation of hydroelectric power plants that extends back more than half a century. Including the Sakuma Power Plant, which began operations in 1956 in a bid to solve postwar power shortages, J-POWER has developed many large-scale conventional hydro-electric power plants. Subsequently, from the 1970s onward, the Company developed large-scale pumped storage hydroelectric power plants, such as that at Shintoyone.

A salient feature of J-POWER's hydroelectric power plants is the large capacity of each unit. Through its mainstay conventional hydroelectric power plants and pumped storage plants built at rivers with an abundant volume of water, the Company contributes to the power supply around the country. Because hydroelectric power plants are capable of changing output extremely quickly to respond to demand fluctuation, they can cover peak demand in daily and seasonal supply-demand balancing in Japan's grid. Furthermore, hydroelectric power represents a valuable domestic energy resource and, as a CO₂-free power source, plays a central role in renewable energy. Having developed its hydroelectric power business over a period spanning many years, J-POWER responds appropriately to natural disasters and to the problems caused by sediment deposits that accumulate in dam reservoirs. While continuing efficient maintenance and management of power plants, the Company strives to ensure stable and long-term operation of its hydroelectric power stations.

Miboro Power Plant (Gifu Prefecture)

Sakuma Power Plant (Shizuoka Prefecture)

Ikehara Power Plant (Nara Prefecture)

Tagokura Power Plant (Fukushima Prefecture)

Comprehensive Renewal and New Capacity

J-POWER is undertaking the comprehensive renewal of its main power generating machinery in hydroelectric power plants. This is aimed at not merely extending the operating lives of its existing hydroelectric power plants and improving their reliability, but also increasing capacity and the power generated through optimal design utilizing the latest technologies. The Company will begin comprehensive renewal work at the Akiba No. 1 Hydroelectric Power Plant in Hamamatsu City, Shizuoka Prefecture, in October 2016.

In resource-poor Japan, hydroelectric power is a valuable indigenous source of energy, and J-POWER undertakes the

development of small- to medium-scale hydroelectric power plants that utilize untapped hydroelectric resources in order to effectively utilize this precious resource to the maximum extent possible. The Konokitani Hydroelectric Power Plant, construction of which commenced in October 2014, will generate a maximum of 199 kW and utilize the Konokitani water inlet's unused head of water at the existing Kuzuryu dam reservoir by providing a weir close to the water inlet and installing a water turbine generator. J-POWER is advancing construction of this project, aiming to commence operations in November 2016.

Domestic Electric Power Business (Wind Power)

Overview of Operations and Salient Features

J-POWER is a pioneer in the wind power generation business in Japan, having commenced operations at its first wind farm in 2000. Since then, the Company has steadily expanded this business and, as of August 31, 2016, owns 21 wind farms (241 units) around the country, with a total output capacity of 429 MW (owned capacity: 415 MW), making it the second largest wind power producer in the country (as of March 31, 2016). Drawing on its many years of experience, expertise, and technologies in the building, operation, and maintenance of power plants and transmission lines, the J-POWER Group has created a system that covers the full gamut of the wind power business, from surveys of wind conditions to wind farm design, construction, and operation and maintenance (O&M). Leveraging its diverse experience, J-POWER is making its O&M systems more efficient while working to improve utilization rates and enhance profitability. The feed-in tariff system took effect in 2012, and J-POWER has acquired facility accreditation under the system for both new and existing wind power facilities.

New Site Development and Offshore Wind Power Initiatives

J-POWER is working towards the development of new capacity. The Company commenced operations of facilities that increased the capacity of Minami Ehime Wind Farm in April 2016 and launched operations at Ohma Wind Farm in May 2016. Yurihonjo Bayside Wind Farm, currently under construction, is scheduled to come online in fiscal 2016. J-POWER will continuously seek locations that possess wind conditions suitable for new facilities and steadily develop new projects in the years to come.

With regard to offshore wind power, the Company has been advancing demonstration studies off the coast of Kita-Kyushu in Fukuoka Prefecture on behalf of and jointly with the New Energy and Industrial Technology Development Organization (NEDO) and will deepen its technical knowledge of offshore wind power generation.

> Domestic Electric Power Business (Transmission/Transformation)

Overview of Operations and Salient Features

As a wholesale supplier of electric power supplying electricity nationwide, J-POWER owns and operates approximately 2,400 km of transmission lines and nine substations and converter stations throughout Japan. In addition to transmitting electric power generated by its own power plants to demand areas, J-POWER supports parts of the grids of electric power companies by connecting the grid of each company, fulfilling a major role in the nationwide operation of Japan's overall power grid.

In particular, we operate critical facilities that support widearea power interchange in Japan, such as interconnecting lines (Kitahon HVDC Link, Honshi Interconnecting Line, Anan-Kihoku HVDC Link, and Kanmon Interconnecting Line) connecting Honshu with Hokkaido, Shikoku and Kyushu as well as the Sakuma Frequency Converter Station, which connects the different frequencies of eastern Japan (50 Hz) and western Japan (60 Hz). J-POWER's transmission/transformation facilities contributed to alleviating the tight regional electricity supply-demand balances that followed the Great East Japan Earthquake. The Company will maintain facility reliability and focus efforts on ensuring stable operations. J-POWER also maintains a communications network throughout Japan that is used for facility protection, monitoring, and control as well as operational management to contribute to the operation of the power plants and the power grid.

Furthermore, in June 2016, the Organization for Crossregional Coordination of Transmission Operators published its Cross-Regional Network Development Plan, which includes plans for increasing the capacity of the Sakuma Frequency Converter Station. J-POWER has been chosen to implement this plan. Accordingly, in line with government policy

requirements and the purpose of the plan—to ensure the stable supply of electric power—the Company is advancing detailed examinations in preparation for construction.

Sakuma Frequency Converter Station

Major Transmission Lines (As of March 31, 2016)

Major Transmission Lines	Beginning of Operation	Location	Distance	Voltage
Tokachi Trunk Line	1956	Hokkaido Prefecture	214.4 km	187 kV
Kitahon HVDC Link	1979	Hokkaido Prefecture – Aomori Prefecture	167.4 km	DC±250 kV
Tadami Trunk Line	1959	Fukushima Prefecture – Tokyo Metropolitan Area	216.2 km	275kV-500 kV
Sakuma East Trunk Line	1956	Shizuoka Prefecture – Tokyo Metropolitan Area	197.2 km	275 kV
Sakuma West Trunk Line	1956	Shizuoka Prefecture – Aichi Prefecture	107.7 km	275 kV

Electric Power-Related Business

Overview of Operations and Salient Features

J-POWER operates electric power-related businesses that support the smooth and efficient implementation of its electric power business. Specifically, these businesses are required for the operation of power generation, transmission, and transformation facilities and include businesses undertaking the design, construction, inspection and maintenance of those facilities; importing coal; and transporting coal using the Company's vessels. J-POWER conducts the maintenance of the power-generation facilities of its domestic wholesale electric power business in close partnership with its subsidiaries.

Coal Procurement

J-POWER procures fuel coal primarily from Australia and Indonesia. In Australia, the Company owns interests in three coal-mining projects through subsidiaries.

The global supply and demand of coal can vary greatly due to demand from developing countries, including China and India, trends related to energy resources other than coal, such as liquefied natural gas (LNG), and other geopolitical factors. In view of this situation, J-POWER has an upstream presence with respect to the ownership of coal mines and securing diversified procurement sources to stably procure coal as fuel for thermal power generation over the long term.

Coal Mining Projects

(10 01 110101, 2010)					
Mine Name	Location	Loading Port	Production Volume 2015*1	Investment Ratio* ²	Beginning of Commercial Production
Clermont	Queensland	Dalrymple Bay	13.09 million t	15%	2010
Narrabri	New South Wales	Newcastle	7.61 million t	7.5%	2010
Maules Creek	New South Wales	Newcastle	4.99 million t (Approx. 10.7 million t/yr)	10%	2014

*1 The production volumes in parentheses represent figures for anticipated peak production.

Overseas Business

Overview of Operations and Salient Features

J-POWER has been involved in the overseas consulting business since 1960. Over the many years since, it has undertaken consulting business around the world, including for environmental impact assessments, the adoption of desulfurization, denitrification, and other environmental technologies in coalfired thermal power generation, and the planning, design, and construction supervision of thermal and hydroelectric power and transmission and transformation projects.

Amid ongoing deregulation of electric power industries around the world, J-POWER established a dedicated in-house organization in 1997 and commenced activities that would lead to the development of overseas power generation business that participates in projects by investing capital and technologies in overseas markets where ongoing strong demand is expected.

At first, the focus was on participation based on a model of partial involvement in the building and operation of power plants through comparatively small-scale capital investment. Amid intense competition, the Company steadily built up its experience and track record and expanded its business participation to major capital investment and greenfield projects. In Thailand, J-POWER started business participation in 2000, and operations at the large-scale gas combined cycle Kaeng Khoi 2 Power Plant commenced in 2007. Furthermore, beginning in 2013, gas-fired thermal power plants came on stream as SPP and IPP projects through Thai consolidated subsidiaries of which J-POWER is the major investor.

In addition, having launched a local subsidiary and started full-scale business development in the United States in 2005, J-POWER commenced its first commercial operations of a U.S. greenfield project, the Orange Grove Power Plant, in 2010.

Owned Capacity*1 (In Operations) and Equity Equivalent Income*2 of Overseas Power Generation Business

*1 Owned capacity [left]: Calculated as the total project capacity multiplied by J-POWER's equity ratio; figures are amounts recorded at the fiscal year-end.

*2 Equity equivalent income [right]: The total of equity income of affiliates and consolidated project equity equivalent income. Out of which consolidated project equity equivalent income is the total of income after tax for each consolidated project company in commercial operation multiplied by the capital investment ratio of the company. To indicate the actual status of equity equivalent income, foreign exchange gains and losses are deducted.

Project Development at Consolidated Subsidiaries in Thailand

Through its local consolidated subsidiaries, J-POWER has developed seven 100 MW class gas-fired thermal power projects (7 SPPs project) in line with the Thai government's SPP program and two large-scale gas-fired IPP projects (1,600 MW each). As a result of these efforts, the 7 SPPs project came online in 2013, the Nong Saeng IPP project in 2014, and the U-Thai IPP in 2015.

A long-term power purchase agreement (PPA) has been signed with the Electricity Generating Authority of Thailand

(EGAT) for each of these projects, under which they will supply electricity to EGAT for 25 years. The 7 SPPs project supplies power, steam, and cold water to customers in the industrial park close to the power plants, in addition to the power supply to EGAT.

Through the operating companies for these nine projects, of which J-POWER is the major investor through its local Thai subsidiary, the Company sets up project finance and conducts construction, operation, and maintenance.

Overviews of P	roject De	evelopment at	t Consolidated	Subsidiaries	in T	hailand	(As of August 31, 2016)
----------------	-----------	---------------	----------------	--------------	------	---------	-------------------------

Project Name Overview 7 SPPs*1 • Seven 100 MW class cogeneration gas-fired thermal power plants based on the Thai Government's Capacity: Total 790 MW SPP program.*1 • The projects will sell electricity to the Electricity Generating Authority of Thailand (EGAT) and nearby (110 MW×5) customers for 25 years (they will also supply steam and cold water to nearby customers). (120 MW×2) • After a transfer of equity of Gulf JP Co., Ltd. to the local partner in August 2016, J-POWER holds Type: CCGT*3 Start of operation: 2013

a 60% stake in six plants and a 45% stake*2 in one plant.

*1 SPP (Small Power Producers) program: The long-term power purchase scheme established by the Thai government. This scheme promotes cogeneration systems, renewable energy, and similar methods, and aims at reducing the import and use of fuel oil. EGAT guarantees the purchase of electricity generated from eligible suppliers up to 90 MW of capacity.
 *2 As for the NLL project of the 7 SPPs project, a part of its stake was sold to an operating company of its industrial park on January 2013.
 *3 CCGT: Combined Cycle Gas Turbine

*3 Gemeng International Energy Co., Ltd., is an electric power company that owns 14 power generation companies. *4 Although power purchase agreements are renewed every year, J-POWER makes other agreements with power purchasers for continuous power purchase during operations.

Other Business

Overview of Operations and Salient Features

Aiming to fully utilize the management resources and knowhow at its disposal, J-POWER operates multifaceted businesses. These include telecommunications businesses through its consolidated subsidiaries and affiliates as well as environmentrelated businesses involving the production of solid fuel from sewage sludge for use as biomass fuel at coal-fired thermal power plants. In addition, J-POWER is active in innovative power businesses, such as waste power generation and cogeneration systems, and provides technical consulting services in Japan.

Main Projects under Other Business

(As of March 31, 2016)				
Project Name	Location	Business	Ownership (%)	Year Operation Commenced

*1 PFI (Private Finance Initiative): The method of conducting public-sector projects from construction through the operating stages by drawing on private-sector funding, management know-how, technology, and other resources.

*2 DBO (Design, Build, Operate): A system whereby the public sector finances projects and then commissions the private sector to undertake their design, building, and operation
Management System

- **36** Corporate Governance
- 39 Compliance
- 40 Directors, Audit & Supervisory Board Members, and Executive Officers

Basic Philosophy

In accordance with the J-POWER Group Corporate Philosophy, the Company endeavors to enhance corporate governance on an ongoing basis in order to realize sustainable growth and increase corporate value over the medium-to-long term.

The Company has established the Basic Policy on Corporate Governance, outlining its fundamental approach to and policy regarding corporate governance. For more information about the Basic Policy on Corporate Governance (established October 30, 2015) and the Corporate Governance Report, please refer to the J-POWER Group website. URL: http://www.jpower.co.jp

Corporate Governance System

Having built a corporate governance system that centers on two units—the Board of Directors, which has 14 members, including 3 outside directors, and the Audit & Supervisory Board, which has 5 members, including 3 Outside Audit & Supervisory Board Members—J-POWER has been strengthening its supervisory and monitoring functions.

Senior directors* and executive officers are responsible for executing operations, and a system of mutual oversight through, for example, Board of Directors' meetings has been built. To strengthen the supervisory function of the Board of Directors, J-POWER installs a chairman who focuses on supervisory functions as a director, and appoints outside directors who participate in the Company's management decision making with an independent perspective. In addition, Audit & Supervisory Board Members attend Board of Directors' meetings and other meetings, and they are positioned to constantly monitor the directors' execution of their management duties. At least half of the Audit & Supervisory Board Members are Outside Audit & Supervisory Board Members with abundant experience in such fields as the management of leading Japanese listed companies or the execution of governmental policies, and we are confident that their inclusion in our corporate governance system enables the system to fully carry out its functions.

A director's term of office is for one year. The outside directors and Outside Audit & Supervisory Board Members are all independent corporate officers (outside directors and Outside Audit & Supervisory Board Members with a high level of independence and no potential conflicts of interest with ordinary shareholders) in accordance with the Securities Listing Regulations of the Tokyo Stock Exchange.

* Senior directors: chairman, president, and executive vice president

Corporate Governance Framework and Internal Control System (As of June 23, 2016)

Legal Compliance of Directors and Employees in the Execution of Their Duties

In accordance with the J-POWER Group Corporate Philosophy and the J-POWER Group Corporate Conduct Rules, directors take the initiative in displaying exemplary honest and fair conduct based on a firm spirit of respect for the law and a solid sense of ethics while also endeavoring to instill similarly rigorous conduct standards among all J-POWER employees.

The directors make it known to all employees that they are not to maintain any kind of relationship with antisocial elements that threaten the safety and order of civil society. In addition, through having set up an internal department to act as a point of contact in the event that demands are received from antisocial elements, J-POWER maintains a system that enables it to rapidly gather information, liaise with specialist external agencies, and appropriately respond.

System for the Execution of Directors' Duties

The Board of Directors meets monthly, in principle, and also on an as-needed basis, with the attendance of all directors and Audit & Supervisory Board Members, including outside directors and auditors. The Executive Committee meets every week, in principle, with the attendance of all senior directors, executive managing officers, and full-time Audit & Supervisory Board Members. This committee discusses matters that will be subject to deliberation by the Board of Directors as well important matters related to business execution of the president and executive vice presidents in line with decisions approved by the Board of Directors that have impact on the entire Company. Management Executing Committee meetings are held twice each month, in principle-with the attendance of all senior directors and executive officers relevant to the matters under discussion as well as all the full-time Audit & Supervisory Board Members-to discuss important matters concerning each item of business execution. In addition to allocating functions among the Board of Directors, the Executive Committee, and the Management Executing Committee, we have introduced an executive officer system in which senior directors and executive officers share responsibility for operational execution. Under this system, management responsibilities and authorities are clearly defined, which enables appropriate and speedy decision making and efficient corporate management.

The senior directors and executive officers provide reports regarding the performance of their duties to the Board of Directors or the Executive Committee on a regularly scheduled basis as well as on an as-needed basis. In accordance with relevant laws and regulations and Company regulations, the minutes of those reports are prepared and appropriately stored and managed. Other documents related to the performance of duties are also properly prepared, stored, and managed in accordance with Company regulations.

In addition to maintaining these supervisory and monitoring functions, to ensure that operations are conducted in a proper manner, we have established the Internal Audit Department, which conducts internal audits from a perspective that is independent of other operating units. Moreover, each operating unit regularly conducts self-audits with respect to its own operational execution.

Regarding the disclosure of information to those outside the Company, we are seeking to improve the transparency and accountability of our corporate activities and have, therefore, established the Disclosure Committee. Chaired by the president, this committee works to ensure that the Company discloses information that is fair and transparent in a timely and proactive manner.

Advisory Board

Aiming to further improve our corporate governance, we have established the J-POWER Advisory Board, which provides a forum for experts from outside the Company to provide advice and suggestions designed to increase corporate value based on diverse, objective perspectives. Comprised of four outside members and inside members (all senior directors, including the president), the J-POWER Advisory Board meets several times each year. Rather than recruiting outside members with expertise directly related to the energy business, we have emphasized the selection of people who have a broad range of experience and insight and are well positioned to actively provide opinions related to the state of management, management plans, and important corporate challenges and objectives.

Outside Member (As of June 23, 2016)	rs of the J-POWER Advisory Board
Takamitsu Sawa	Distinguished Professor, Shiga University
Nobuhiko Shima	Journalist
Mieko Nishimizu	Senior Partner, Think Tank SophiaBank
Takashi Wachi	Former Director and Honorary Chairman,
	Terumo Corporation

Audits by Audit & Supervisory Board Members

In accordance with the Companies Act, J-POWER appoints Audit & Supervisory Board Members, who audit the legality and appropriateness of directors' business execution. At J-POWER's headquarters, Audit & Supervisory Board Members conduct audits by attending the Board of Directors' meetings and other important meetings and observing the status of the execution of directors' and executive officers' duties. In addition, the Audit & Supervisory Board Members perform site visits to local operating units and subsidiaries in Japan and overseas.

In the course of accounting audits, Audit & Supervisory Board Members liaise with the independent auditors to regularly receive reports and exchange opinions regarding auditing schedules and results as a means of ensuring consistency with the independent auditors' auditing methods and results.

When performing audits, Audit & Supervisory Board Members liaise with the Internal Audit Department.

With regard to staff under the Audit & Supervisory Board Members, we have established the Office of Audit & Supervisory Board Members as an independent unit outside of the directors' chain of command. The office's full-time specialist staff assist the Audit & Supervisory Board Members in the course of their audits.

Group Governance

With regard to the administration of subsidiaries and affiliates, the J-POWER Group's basic policy calls for Group-wide business development in accordance with the Group's management plan. The administration of subsidiaries and affiliates is undertaken in accordance with the Company's internal regulations, and the Group Management Committee works to ensure the appropriateness of operations for the entire corporate Group. In addition, the Audit & Supervisory Board Members and the Internal Audit Department implement audits of subsidiaries and affiliates with the objective of ensuring proper operations at all Group companies.

In addition, we have established a meeting of Group leaders with the objective of promoting information exchanges and other activities within the Group as a whole. This meeting is held several times each year with the attendance of the president as well as such other participants as directors, executive officers, full-time Audit & Supervisory Board Members, general directors of domestic and overseas units of the Company, and representatives of principal subsidiaries. Besides promoting the awareness of issues with respect to which the Group should be concertedly sharing information and implementing, participants make requests and exchange opinions related to those issues.

Risk Management

With respect to risks associated with the execution of corporate activities, J-POWER incorporates mutual checks and balances in its decision-making processes, undertakes discussions in various meetings and committees, and always maintains risk management frameworks in accordance with Company regulations. These initiatives are designed to ensure the awareness of risks and risk avoidance measures as well as to minimize the impact of any damage eventuating from risks.

Response to Internal Control and Reporting System

With respect to the financial reporting-related internal control and reporting system stipulated in Japan's Financial Instruments and Exchange Act, the J-POWER Group's internal control systems are established, operated, and evaluated mainly by the Accounting & Finance Department and Internal Audit Department.

In fiscal 2015, as in the previous year, evaluations of the development and operation of internal controls were conducted by management with respect to Company-wide internal controls, operational process-related internal controls, and information technology-based internal controls in accordance with the implementation standards of Japan's Financial Services Agency, and it was determined that the Company's financial reporting-related internal control system is effective. Compiled in the form of an Internal Control Report, this evaluation result was submitted to the Director-General of the Kanto Finance Bureau in June 2016 following an audit carried out by the Company's independent auditors.

Going forward, the J-POWER Group will continue verifying the efficacy of its internal control system and ensuring the reliability of its financial reporting.

Compliance

Based on the J-POWER Group Corporate Philosophy, we have formulated the J-POWER Corporate Conduct Rules, which are basic guidelines for behavior in line with compliance and business ethics principles that must be observed in the course of implementing business operations and set forth basic principles for compliance. The Compliance Code lays down moreconcrete decision-making standards for actions taken by individual employees, including members of management, when conducting business activities. In addition, the Company distributes copies of The Compliance Manifesto to all employees and works to encourage the awareness of compliance by having them sign and carry the manifesto with them.

J-POWER has given its chairman responsibility for overseeing Company-wide compliance. The Company's compliance promotion system centers on the director in charge of compliance, who implements compliance promotion programs and assists the chairman and president in this regard. In addition, the Compliance Action Committee, chaired by the chairman, has been established to discuss Company-wide compliance promotion measures, evaluate the implementation status of them, and address issues related to compliance violations. quickly and accurately promote operations pertaining to compliance promotion, two task forces have been set up, one regarding Companywide compliance promotion and the other autonomous safety activities based on the safety regulations of the Company. Two executive vice presidents have been assigned to chair these task forces.

At such major operating units as branches and thermal power plants, compliance committees are also established in individual units to carry out compliance activities tailored to the special characteristics of each unit. Group companies also participate in these compliance committees so that compliance activities are consistently promoted throughout the Group. Compliance Consulting Points have been established at the Internal Audit Department and at an external law firm to serve as a consulting hotline in the event that employees face compliance issues. The employees who are seeking or have attended a consultation are rigorously protected.

The J-POWER Group is working to promote compliance by dividing compliance-related duties and responsibilities among these units while also encouraging cooperation and collaboration among the units.

Environmental Management and Corporate Social Responsibility Initiatives

Based on its Corporate Philosophy of meeting people's needs for energy without fail and playing its part for the sustainable development of Japan and the rest of the world, the J-POWER Group is continuously pursuing initiatives aimed at achieving both stable electricity supply and environmental preservation through its corporate activities. For information about such initiatives, please see the J-POWER Group's Sustainability Report. URL: http://www.jpower.co.jp/english/company_info/environment/er_2015index.html

The J-POWER Group's Compliance Consulting Point

Directors, Audit & Supervisory Board Members, and Executive Officers

(As of June 22, 2016)

Chairman Representative Director Masayoshi Kitamura Company-wide compliance

Financial Results

Operating Income

Sales (operating revenues) for the year ended March 31, 2016 (fiscal 2015), increased 3.9% from the previous fiscal year to ¥780.0 billion. This was due in part to the full operation of the Nong Saeng IPP gas-fired thermal power project in Thailand, which came online in 2014 (Unit No. 1 and Unit No. 2 in June and December 2014, respectively), throughout the fiscal year, as well as the commencement of operations of the U-Thai IPP gas-fired thermal power project, also in Thailand (Unit No. 1 and Unit No. 2 in June and December 2015, respectively).

Turning to expenses, due mainly to a rise in fuel costs accompanying the full-year operation of Nong Saeng IPP and the start of operations at U-Thai IPP, operating expenses increased 2.2% from the previous fiscal year to ¥692.6 billion.

As a result, operating income increased 19.9% from the previous fiscal year to ¥87.3 billion. The operating income margin increased 1.5 points to 11.2%.

Ordinary Income

In fiscal 2015, non-operating income decreased 21.3% from the previous fiscal year to ¥17.8 billion, due in part to a decrease in equity income of affiliates.

Non-operating expenses for the year increased 30.3% to ¥47.2 billion due to such factors as a rise in foreign exchange losses.

Consequently, ordinary income amounted to ¥58.0 billion, a 2.2% decrease from the previous fiscal year. The ordinary income margin decreased 0.5 of a percentage point to 7.4%.

Ordinary income by reporting segment for the fiscal year under review is as follows.

Electric Power Business

In the wholesale electric power business, electricity sales volume from hydroelectric power plants for the fiscal year under review showed a 14.3% increase to 10.3 TWh, mainly because the water supply rate increased from 98% in the previous fiscal year to 111%. In thermal power, due partly to an increase in the load factor from 76% to 80%, electricity sales volume grew 4.6% from the previous fiscal year to 55.0 TWh. Total electricity sales volume from both hydroelectric and thermal power plants in the wholesale electric power business increased 6.0% from the previous fiscal year to 65.3 TWh.

Electricity sales volume in the other electric power business decreased 18.7% from the previous fiscal year to 1.9 TWh, due mainly to the exclusion of Ichihara Power Co., Ltd., which was a consolidated subsidiary in the previous fiscal year, from the scope of consolidation (all shares were sold in March 2015). However, electricity sales volume in the electric power business as a whole increased 5.1% from the previous fiscal year to 67.3 TWh.

Sales (electric utility operating revenue) decreased 2.9% from the previous fiscal year to ¥572.4 billion. This was mainly due to decreased revenue from the other electric power business as a result of the exclusion of Ichihara Power Co., Ltd. from the scope of consolidation, despite the increased sales of the wholesale electric power business reflecting the year-on-year increase in the water supply rate of hydroelectric power plants.

Segment income decreased 4.9% from the previous fiscal year to ¥31.7 billion due mainly to the decrease in sales.

Electric Power-Related Business

In fiscal 2015, sales (other business operating revenue) increased 2.3% from the previous fiscal year to ¥359.1 billion due mainly to an increase in revenues from orders received from consolidated subsidiaries for equipment replacement.

Segment income increased 61.2% from the previous fiscal year to ¥14.4 billion due mainly to the increase in sales.

Overseas Business

Electricity sales volume in the overseas business increased 60.1% from the previous fiscal year to 13.8 TWh, and sales (overseas business operating revenue) increased 43.2% from the previous fiscal year to ¥155.9 billion due mainly to the operation of Nong Saeng IPP throughout the term and the commencement of commercial operations of U-Thai IPP.

Segment income decreased 28.2% from the previous fiscal year to ¥11.4 billion due mainly to foreign exchange losses, despite the increase in sales.

Other Business

In fiscal 2015, sales (other business operating revenue) decreased 7.6% from the previous fiscal year to ¥23.0 billion.

Profit before Income Taxes

Profit before income taxes decreased 6.0% compared with the previous fiscal year to ¥57.9 billion due to such factors as the decrease in extraordinary income.

Profit attributable to owners of parent

In fiscal 2015, total income taxes increased 2.0% year on year to ¥17.7 billion. Consequently, profit attributable to owners of parent decreased 8.1% from the previous fiscal year to ¥39.7 billion.

Earnings per Share

Earnings per share were ¥216.99 in fiscal 2015, compared with ¥284.43 in the previous fiscal year.

Dividend Policy

The most-distinctive characteristic of J-POWER's business is that the Company uses its expertise with respect to the construction of power plants and other facilities and the operation of those facilities over the long term to make investments in power plants and other kinds of infrastructure and then seeks to obtain returns on its investments through the long-term operation of those assets.

J-POWER's top priority with respect to shareholder returns is to maintain stable dividend levels in line with the characteristics of its business. Through long-term initiatives, the Company will also work to enhance returns to shareholders in step with efforts to raise corporate value and achieve further growth in a sustainable manner. Based on this fundamental policy, the basic policy with regard to the payment of dividends from the Company's retained earnings is for these to be paid twice a year, as an interim and fiscal year-end dividend. The decision-making body for the interim dividend payment is the Board of Directors, and that of the fiscal year-end dividend payment the Shareholders' Meeting.

For fiscal 2015, the Company distributed a fiscal year-end dividend of ¥35 per share. Together with the interim dividend of ¥35 per share, total dividends applicable to fiscal 2015 amounted to ¥70 per share.

As a result, the payout ratio for fiscal 2015 came to 42.1%, while the ratio of dividends to shareholder's equity was 2.5%.

Financial Position

Assets

As of March 31, 2016, total assets amounted to ¥2,546.2 billion, down ¥112.8 billion from the previous fiscal year-end. This was due mainly to a decrease in current assets.

Liabilities

As of March 31, 2016, total liabilities amounted to ¥1,865.2 billion, a decrease of ¥97.5 billion from the previous fiscal year-end. Of

this amount, interest-bearing debt decreased ¥94.8 billion from the previous fiscal year-end to ¥1,628.7 billion. Non-recourse loans in overseas business accounted for ¥321.7 billion of interest-bearing debt. The debt-equity ratio was 2.4 times, down from 2.5 times at the previous fiscal year-end, due to the decrease in interest-bearing debt.

Segment income increased 32.6% from the previous fiscal year to ¥0.8 billion due mainly to a decrease in cost of sales.

Net Assets

As of March 31, 2016, total net assets had decreased ¥15.3 billion from the end of the previous fiscal year to ¥680.9 billion, due mainly to decreases in foreign currency translation adjustment and remeasurements of defined benefit plans, despite an increase due to the posting of profit attributable to owners of parent. The shareholders' equity ratio increased from 25.9% at the end of the previous fiscal year to 26.4%.

Capital Expenditures

Capital expenditures in fiscal 2015 amounted to ¥126.3 billion, a decrease of ¥20.5 billion from the previous fiscal year. Of that amount, capital expenditures in the electric power business increased ¥52.1 billion from the previous fiscal year to ¥119.2 billion, and capital expenditures relating to overseas business decreased ¥63.6 billion to ¥11.4 billion.

Fund Procurement

Most of J-POWER's financing requirements are related to capital expenditures and debt refinancing, and the Company has a basic policy of procuring long-term funds.

When procuring long-term funds, the Company issues straight bonds and borrows long-term loans from financial institutions as means of maintaining low interest rates and a stable fund procurement platform. The outstanding balances of straight bonds and borrowings as of March 31, 2016, were ¥665.0 billion and ¥934.7 billion, respectively. In addition, the Company obtains short-term funding as a means of procuring operating funds as well as of enhancing the responsiveness and flexibility of procurement operations. To meet short-term funding needs, the Company is currently able to issue up to a total of ¥100.0 billion in commercial paper.

Cash Flows

Cash Flows from Operating Activities

Cash inflow from operating activities was roughly level with the previous fiscal year at ¥146.1 billion.

Cash Flows from Investing Activities

Cash outflow from investing activities decreased ¥11.3 billion from the previous fiscal year to ¥131.5 billion due mainly to a decrease in investment in projects in Thailand, even as investment in the Takehara Thermal Power Plant New Unit No.1 replacement project increased.

As a result, free cash flow was a positive ¥14.5 billion.

Risk Factors

This section discusses the main potential risks related to J-POWER's financial position, business results, current and future business operations, and other matters. From the perspective of actively disclosing information to investors, this section also provides information to help investors understand business and other risks that the Company does not necessarily consider significant.

Impact of Reforms to the Electric Power Business Regulations on J-POWER's Wholesale Electricity Rates and Business

The Policy on Electricity System Reform was approved by the Cabinet in April 2013, bringing about drastic changes to the

Cash Flows from Financing Activities

Cash outflow from financing activities came to ¥88.6 billion, compared with an inflow of ¥143.9 billion in the previous fiscal year. This was mainly because, while the previous fiscal year brought increased inflow from the issuance of new shares, capital procurement by means of corporate bonds and loans payable decreased.

As a result of these activities, cash and cash equivalents as of March 31, 2016, decreased ¥76.4 billion from the end of the previous fiscal year to ¥159.9 billion.

business environment surrounding J-POWER. Amendments to the Electricity Business Act prompted the establishment of the Organization for Cross-Regional Coordination of Transmission Operators in April 2015. Participation in the retail of electric power was fully liberalized in April 2016, while at the same time regulations on wholesale electricity utilities (regulations of business permits and rates) were repealed. Further, the legal unbundling of the transmission and distribution divisions of the former EPCOs and J-POWER will be required, with an approximate deadline of 2020. After the legal unbundling of transmission and distribution divisions, there are plans to review the regulations on electricity retail rates (transitional measures) for the former EPCOs. With the revision of electric power business types in the system reforms, as of April 2016, J-POWER has changed from a wholesale electricity utility as prescribed in the Electricity Business Act prior to amendment to an electricity utility that conducts power generation and transmission businesses. Cost-basis rate regulations have been repealed, and rates related to the power generation business are now determined upon consultation with customers based on market competition. Rates related to the transmission business remain regulated, with a cost-basis rate system, to maintain a healthy transmission and distribution network system.

The majority of J-POWER's operating revenue comprises rate income from domestic sales to the former EPCOs. As market competition in the power generation business advances, to ensure that the value of our power generation business receives adequate assessment, we are therefore proceeding with appropriate rate consultations with customers, primarily the former EPCOs, while proceeding to diversify customers and trade using the Japan Electric Power Exchange (JEPX).

Still, in the case that there are major changes to business plans or operations due to shifts in long-term electricity demand, further market competition, consultations with customers, faults with facilities, or legislation, and such shifts cause an inability to secure adequate revenue to cover power generation costs, such a situation may adversely affect our performance.

Global Warming

J-POWER owns many coal-fired thermal power plants, which emit a relatively higher level of CO₂ with respect to power output compared to power plants using other fossil fuels, such as LNG. The Company is working to increase the efficiency and reduce the carbon emissions of its coal-fired thermal power. Also, we are working to expand our use of CO₂-free power sources, such as renewable energy, and developing nuclear power plants. Furthermore, based on the electricity business's Action Plan for Achieving a Low-Carbon Society established by electricity utilities including J-POWER in July 2015, we will do our utmost to achieve the targets set for the overall electric power industry.

However, going forward, if new legal regulations or other rules related to global warming countermeasures were to be introduced, causing major changes to business plans or operations, it could potentially have an adverse effect on our performance.

New Businesses in and Outside Japan, Including Overseas Power Generation Business

J-POWER aims to build a new revenue platform by engaging in new electric power businesses domestically and overseas, including the overseas power generation business.

Specifically, in the overseas power generation business, we are applying the experience gleaned through our consulting services businesses in various countries in the pursuit of independent power producer (IPP) projects.

Also, in domestic electric power generation business, we are proceeding with new development of high-efficiency coal-fired thermal power plants as well as power generation businesses utilizing wind, geothermal, waste-fueled thermal and other renewable energies.

However, these businesses may not generate the level of profits that we anticipate, due to unforeseeable circumstances, including major changes in operating conditions; changes in demand or the market environment; and changes in regulations. Changes in our business plans or the suspension of operations or construction prompted by such circumstances could result in related expenses or a need for additional funding that could potentially have an adverse effect on the results of our operations. Furthermore, some of these businesses are operated as joint ventures with third parties. In cases where the joint venture format is revised due to changes in the business environment or J-POWER is a minority equity owner and thus unable to engage in management and administration, the results of the joint venture may not beneficially impact our performance. In addition, overseas businesses entail foreign exchange risk as well as country risk due to political instability and other factors.

Capital Funds

The Company has invested a very large amount in power plants and other facilities. The funds for these investments have been procured mainly through borrowings and the issuance of bonds payable. We anticipate the need to raise funds in the future to invest in new domestic and overseas projects, such as Ohma Nuclear Power Plant and Takehara Thermal Power Plant New No. 1, and to repay existing obligations. If we are unable to raise required funds on acceptable terms and in a timely manner due to the prevailing conditions in the financial markets, the Company's credit situation, or other factors at that time, then this could potentially have material adverse effects on our business development and profitability.

Ohma Nuclear Power Plant Construction Project

With regard to the Ohma Nuclear Power Plant Project, the Japan Atomic Energy Commission concluded in the August 1995 decision that the plant has a policy-oriented role in enhancing flexibility of the plan to use MOX (uranium-plutonium mixed oxide) fuel in light water reactors because the plant adopts an advanced boiling water reactor with a view to using MOX fuel for the entire core (full MOX-ABWR). In addition, the commission expected the implementation of the plan not only by J-POWER, which has primary responsibility, but also under the auspices of the government and EPCOs. Accordingly, under the government's guidelines, the Company receives an R&D grant for the use of MOX fuel for the entire reactor core. Furthermore, the Company has already concluded basic agreements with nine EPCOs, excluding the Okinawa Electric Power Company, that require the nine former EPCOs to purchase the total amount of electricity at fair cost.

As a nuclear power plant using MOX fuel for the entire core, the Ohma Nuclear Power Plant Project received consent from the local municipality of Ohma as well as Aomori Prefecture and was included by the Electric Power Development Coordination Council in the national Electric Power Development Master Plan as laid out by the Electric Power Development Promotion Act in August 1999. (The Electric Power Development Promotion Act was abolished in October 2003, and, with it, the system of the Electric Power Development Master Plan ended. The functions of the plan were taken on by the major power development site designation system, under which the project received site designation in February 2005.) In April 2008, the nuclear reactor installation permit was granted, and, in May of the same year, upon the initial approval of the construction work plan by the Minister of Economy, Trade and Industry, construction began. At that time, planned construction costs were ¥469.0 billion. Construction was suspended immediately after the Great East Japan Earthquake struck in March 2011 but was resumed in October 2012.

On December 16, 2014, we submitted an application for permission for alteration of a reactor installment license and an application for construction plan approval to the Nuclear Regulation Authority (NRA) in order to undergo a review of compliance with the New Safety Standards concerning nuclear power plants enforced by the NRA in July 2013. Specific examples of the wideranging measures include the raising of assumptions and enhancement of countermeasures with regard to earthquakes and tsunamis as design basis measures to prevent severe accidents, combined with the implementing of measures to prevent damage to the core and the containment vessel as severe accident countermeasures newly drawn up under the New Safety Standards. Furthermore, as terrorism countermeasures, such as the deliberate crashing of an aircraft, we have decided to install the specified severe accident response facility that will enable reactor decompression and other functions to be controlled remotely to inhibit the abnormal release of radioactive material outside due to damage sustained by the reactor containment vessel. The construction work for the additional safety enhancement measures compiled in the above-mentioned application will commence following confirmation that the content of the Company's application conforms to New Safety Standards when reviewed by the NRA. The Company forecasts that the additional construction work will cost approximately ¥130.0 billion. Moving forward, J-POWER will seriously and appropriately respond to the NRA's conformity reviews and steadily implement necessary safety measures or other measures required in a full-scale effort to build a safe power plant.

While it is impossible to predict the progress of the compliance review as an examinee, we aim to start construction work of the additional safety enhancement measures in November 2016 and complete it in December 2021. However, the construction work schedule for the additional safety measures may be extended depending on changes surrounding the nuclear power business, the status of reviews by the NRA, and additional response to the New Safety Standards. Also, in such events, construction expenses may increase further, and other related costs may arise. In addition, nuclear power generation involves various risks, such as revisions of plans due to significant changes in conditions around the nuclear power business caused by review of Japan's nuclear policy, the advance of market competition, or other unexpected circumstances, as well as those associated with the storage and handling of radioactive materials, and risks other electric power plants are exposed to, such as natural disasters and unforeseen accidents after operations have commenced. J-POWER intends to ensure that these risks are avoided or minimized. However, if any of these risks should eventuate, it could adversely affect the business performance of the Company.

Fuel for Coal-Fired Thermal Power

J-POWER's coal-fired thermal power plants use imported coal as their main source of fuel. In procuring imported coal, the Company purchases coal from diverse sources in Australia, Indonesia, Russia, South Africa, and elsewhere to seek both stable and economical supply. In addition, the Company holds interests in some coal mines aiming for stable coal supply. The Company's imported coal procurement is handled mainly under long-term or approximately one-year contracts, with spot purchasing to fill gaps as necessary. Coal purchase prices under long-term contracts are normally adjusted once per year in light of market prices.

The Company's fuel cost is impacted by such factors as changes in imported coal prices, supply and demand for transport vessels, and problems with the facilities or operations of suppliers. According to the power purchase agreements with customers for our major coal-fired thermal power plants, the electricity rates corresponding to fuel price properly reflect market conditions relating to fuel procurement. As a result, fluctuations in fuel cost have a limited impact on the business performance of J-POWER. However, if coal prices rise sharply, there will be a delay before the rise in fuel prices is reflected in electricity rates. This could have a temporary adverse effect on the results of our operations. Furthermore, should a significant fall in coal prices have a significant effect on the performance of the mine in which the Company holds an interest, the Company's performance could also be adversely affected.

Natural Disasters and Accidents

Should a natural disaster, human error, terrorist activity, fuel supply stoppage, or other unforeseen circumstance result in a major disruption of one of J-POWER's power plants or transmission or transformation facilities, or should such an event disrupt the information systems that control operations at these facilities, this could potentially hamper our business operations and consequently have an adverse effect on the surrounding environment. To prevent accidents at power plants as well as transmission and transformation facilities, which are important infrastructure for Japan, to ensure the safety of involved parties and to preserve the surrounding environment, J-POWER works to establish security and disaster prevention systems, take accident and disaster prevention measures and emergency response and recovery countermeasures, and implement environmental monitoring.

Nevertheless, if an accident or other events were to halt operations of J-POWER's power plant, transmission or transformation facilities, or if an accident or other events were to negatively impact the surrounding environment, the Company's performance could be adversely affected.

In line with the Amended Electricity Business Act of June 2014, regulations related to wholesale electricity utilities (regulations on business permits and rates) stipulated in the previous act were repealed in April 2016. However, J-POWER will continue to be regulated under the act as an electricity utility that conducts power generation and transmission businesses. Thus, J-POWER is subject to business and safety regulations as well as change and suspension orders derived from such regulations, and also to provisions regarding the cancellation of licenses to operate transmission businesses. Thus, where we are unable to comply with such laws and regulations, or if such laws or regulations are amended, these may adversely affect our business operations and performance. The Company's business operations are also subject to various other laws and regulations. If the Company is unable to comply with these laws and regulations, or if these laws and regulations are revised, this could potentially have an adverse effect on our business operations and performance.

Also, based on the concept of mutual aid for nuclear power operators, nuclear power business operators are obligated to contribute to expenses required for the Nuclear Damage Compensation and Decommissioning Facilitation Corporation, based on the Nuclear Damage Compensation and Decommissioning Facilitation Corporation Act, which aims to build a system that centers on a facilitation organization that can respond to nuclear damage compensation into the future. In relation to the Ohma Nuclear Power Plant project, which is currently underway, J-POWER will pay contributions once the Ohma Nuclear Power Plant commences operation of the nuclear reactor, as stipulated in the Act on Compensation for Nuclear Damage. Depending on the amount of such contributions, this may adversely affect the performance of the Company.

Management of Business Information

J-POWER holds a large amount of important information that must be kept confidential, including personal information. J-POWER controls this information carefully by implementing information security measures, employee training programs, and through other means. However, a leak of sensitive information outside the Company could adversely affect J-POWER's reputation and business performance.

Legal Regulations

J-POWER's mainstay electric power business is subject to the Electricity Business Act.

Financial and Operating Highlights

*Changes to certain accounting methods applied in the year ending March 31, 2017 are not reflected in the figures presented for the fiscal year ended March 31, 2016.

Note: In accordance with revisions in Electric Utility Accounting Regulations, wind power and geothermal power production facilities are recorded as "Renewable Power Production Facilities" from the fiscal year ended March 31, 2010.

Until the year ended March 31, 2012, "Overseas Business Facilities" was included in "Other Noncurrent Assets," but it has been presented separately from the year ended March 31, 2014 due to the increase in monetary importance due to progress in the Thai projects. For year-on-year comparison purposes, it is also presented separately in the year ended March 31, 2013.
